

Phase 2 — DTS Publishing Integration: Deployment Steps

Goal: replace `upload_to_btsm()` stub with real DTS upload.

1. Drop new files into FullAutomation

—

Save these three files to:

C:\Users\ryanr\Documents\BTSM\FullAutomation\

```
upload_to_dts.py
test_upload_to_dts.py
```

2. Append the env vars

Open `.env` in the FullAutomation folder.

Append the contents of `env_upload_additions.txt`.

Replace the placeholder `DTS_UPLOAD_SECRET` value with the real secret from your text file (same one you put in Vercel).

3. Run the unit tests — should all pass before touching `run_pipeline`

```
cd C:\Users\ryanr\Documents\BTSM\FullAutomation
python test_upload_to_dts.py
```

Expected: "All 11 tests passed"

4. Live dry-run against the real endpoint

Find any old PDF in the output folder (or use the test PDF you uploaded by curl during Phase 1). Then:

```
python upload_to_dts.py output\some_existing.pdf ^
--track LRL --race-date 2026-05-15 --dry-run
```

Expected: prints "DRY RUN — would POST" with the fields shown.
No HTTP call is made.

5. Live test against the real endpoint (small one-off)

Use a non-conflicting label like a test PREVIEW for a track you're not running today. Drop --dry-run:

```
python upload_to_dts.py output\some_existing.pdf ^  
--track ZZZ --race-date 2026-05-15
```

Expected:

[upload_to_dts] OK 20260515-ZZZ-PREVIEW.pdf → https://...

Then verify in Supabase: row in `sheets` table. And in Vercel Blob: blob exists. And in browser: <https://downthestretch.ai/sheets/20260515-ZZZ-PREVIEW.pdf> (may require entering the listing-page password first).

If anything fails, check the email — upload_to_dts fires Gmail alerts on every failure via the same notify.py path.

6. Patch run_pipeline.py

Back up first:

```
copy run_pipeline.py run_pipeline.py.bak
```

Apply the three edits in run_pipeline_PATCH.txt.

Verify with:

```
python -c "import ast; ast.parse(open('run_pipeline.py').read()); print('OK')"  
findstr /N upload_to_btсм run_pipeline.py  
findstr /N upload_to_dts run_pipeline.py
```

The btсм findstr should return nothing.

The dts findstr should return 3 hits (1 import + 2 call sites).

7. Pipeline dry tick

If today is a race day, the next scheduled poller tick will exercise the integration. If not, you can wait for the next race day to confirm end-to-end — Phase 2 is mechanically done at this point.

If you want immediate confirmation, run a manual tick:

```
python run_pipeline.py
```

Pick a track that's already published today (so PREVIEW is skipped) and watch for FINAL to fire inside an anchor window — or just inspect the logs to confirm the new `upload_to_dts` line appears where the old `[stub] upload_to_btsm` line used to.

Done.

Phase 2 is complete when:

- ☐ `test_upload_to_dts.py` passes 11/11
- ☐ A manual upload via the CLI lands in Supabase + Vercel Blob
- ☐ `run_pipeline.py` imports cleanly and `findstr` confirms 3 hits
- ☐ One live pipeline tick auto-publishes a sheet
